

NVC360 Driver — iOS TestFlight Release

Config is ready. iOS builds run on Expo's servers (not the sandbox), so the actual build + submit happens through the **Runnable mobile preview** → **Publish** flow (same place you've been pushing), using the Expo account already linked to this project.

What's configured

Item	Value
Display name	NVC360 Driver
iOS bundle identifier	com.nvc360.uberize (permanent)
Marketing version	1.0.0
Build number	auto-incremented by EAS (appVersionSource: remote)
Push entitlement	aps-environment: production
Background modes	location , remote-notification
Location perms	always + when-in-use strings set, background location on
Camera / Photos perms	set (expo-image-picker)
App icon	assets/icon.png — 1024×1024, no alpha (App Store compliant)
Build resource class	m-medium (production/preview/development)

eas.json profiles: development (internal dev client), preview (internal), production (store build, autoIncrement). Submit profile expects an App Store Connect API key at ./keys/AuthKey.p8 .

Steps (Runnable Publish flow)

1. Open the **mobile preview dashboard** → **Publish**.
2. Choose **iOS / production** build profile.
3. When prompted for signing, let EAS **manage credentials** (it will create the distribution certificate + provisioning profile under your Apple Developer

account — needs your Apple ID / App Store Connect access). First build for `com.nvc360.uberize` will register the App ID automatically.

4. Build runs on Expo's servers (~10–20 min). Result is a `.ipa`.
5. **Submit to TestFlight** — either:
6. Let the Publish flow submit it directly (recommended), or
7. Provide an App Store Connect **API key** (Users & Access → Integrations → App Store Connect API → generate key with *App Manager* role). Download the `.p8`, place it at `packages/mobile/keys/AuthKey.p8`, and note the **Key ID** and **Issuer ID** for `eas submit`.
8. In App Store Connect, the build appears under **TestFlight** after Apple processing (~5–15 min). Add internal testers (your team) — no review needed. External testers require a quick Beta App Review.

Notes / gotchas

- **Bundle ID is permanent.** `com.nvc360.uberize` is now locked into App Store Connect once the first build registers it.
- **First push test:** APNs uses the `aps-environment: production` entitlement. Production push tokens only work on TestFlight/App Store builds (not Expo Go).
- **Background location:** Apple reviewers scrutinize "always" location. The usage strings explain the dispatch/ETA use case — keep that justification handy if asked during external-tester review.
- **Android mirrors iOS:** package `com.nvc360.uberize` (= iOS bundle ID), same name/version/icon. Android `permissions` array now explicitly declares location (coarse/fine/background), foreground service (+location), notifications, camera, and media — mirroring the iOS capabilities. Ready for a Play Store / internal track build via the same Publish flow when you want it.
- Source artwork for the icon: `assets/icon-source.png` (2048², with alpha) if you ever need to regenerate.
